

# S&P GLOBAL INC. (SPGI)

## FINANCIAL PERFORMANCE REPORT

*Nastase David - March 9, 2026*

### COMPANY & BUSINESS

---

S&P Global is a massive U.S. financial data and analytics powerhouse that operates at the core of global capital markets. Following its 2022 merger with IHS Markit, the company transformed from a traditional ratings agency into a highly diversified data ecosystem. Today, it sits alongside giants like Moody's and Bloomberg, providing essential infrastructure—including credit ratings, market data analytics (MDA), commodity and energy trading, and index creation (such as the S&P 500)—to investors, banks, and governments. The firm operates through key divisions: S&P Global Ratings, Market Intelligence, Mobility, Engineering Solutions, and Dow Jones Indices. The credit ratings segment remains the cornerstone of its profitability, consistently maintaining high margins near 50%. Given this systemic importance and established market leadership, the firm acts as essential, non-discretionary infrastructure for global finance.

### PEOPLE & LEADERSHIP

---

The leadership team has undergone strategic restructuring to support long-term growth. Recent changes in the Executive Leadership Team—including the transition in the CEO role and leadership updates within the Dow Jones Indices division—reflect a standard corporate evolution toward modernization rather than signs of scandal. The leadership composition remains professional and focused on operational integration, with no reported ethical controversies impacting the current governance structure. Furthermore, the firm maintains a strong commitment to shareholder value, recognized as a "Dividend King" with 50 consecutive years of dividend growth.

### VALUATION & KPI ANALYSIS

---

Historical valuation metrics reflect shifting market expectations and cyclical adjustments. The EV/EBITDA ratio averaged approximately 24.7x between 2021 and 2025, before moderating to approximately 19.5x by early 2026, signaling a return to more sustainable valuation levels. The P/E ratio has also demonstrated volatility; while it reached highs above 50x in mid-2023, it has compressed to approximately 30.8x, reflecting current market caution.

| Metric             | Value    |
|--------------------|----------|
| Current Price (CP) | \$452.36 |
| Target Price       | \$566.87 |
| Implied Upside     | 24.71%   |
| Dividend Yield     | 0.86%    |
| EV/EBITDA (LTM)    | 19.5x    |
| P/E Ratio (TTM)    | 30.86x   |

### FINANCIALS & MARKET DYNAMICS

---

S&P Global's revenue is heavily dependent on corporate debt issuance volumes. After the surge in bond issuance during 2024 and 2025, the market entered a "refinancing lull" in 2026 as companies wait for interest rates to decrease before refinancing loans at better IR's. This anticipation of lower transaction volume explains the downward pressure on the stock price in early 2026, as investors factor in a temporary slowdown in the high-margin ratings segment.

Figure 1: Federal Funds Effective Rate (2017–2026)

## RISKS AND OPPORTUNITIES

- **Credit Risk:** If interest rates remain elevated, the refinancing lull may persist, directly impacting transaction volume in the highly profitable ratings segment. To which investors have taken action by selling stock early-January, hence the recent dip.
- **Inflationary Pressure:** Implemented 10% tariffs under Section 122 create a challenging environment; premature rate cuts could trigger inflation, causing bond yields to rise and suppressing new debt issuance, lowering transaction volume for SPGL.
- **Monetary Catalysts:** Potential Federal Reserve rate cuts to the 2.5%–3% range, spurred by executive pressure for a pro-growth agenda, serve as a significant catalyst to stimulate borrowing and reignite the debt markets. Taking into account the pressure that is being applied by the US White House for nominating a pro-Trump FED chairperson, the future of US monetary policy might be attractive for our investment.

## CONCLUSION

The **hold** reason is obvious: With a 135.15B\$ Market cap, it is one of the giants in MDA (Among Moody's and Bloomberg) and with the credit rating business being very profitable with high margins nearing 50%. While also being known for increasing their dividend yield for 50 years. The stock is currently sitting much below its ATH of 564.15\$ (11/08/2025) – at CP of 452.36\$ (08/03/2026). The target price represents a 24.71% increase from CP. With certified investors advocating for a strong buy – S&P Global Inc StockAnalysisOverview.

Overall, S&P Global remains a fundamentally strong asset with systemic market importance. While near-term cyclical headwinds persist, the company's current valuation discount and consistent shareholder returns make it a compelling hold for long-term growth. Or at least for 1-2 more years from our own investment stand point.
